EXPERIMENT 08

User Management and Role-Based Access

Title: Job Application Management System

Aim

To manage application users and assign suitable roles and permissions in the Job Application system, so each user can access only the features needed for their work.

Procedure

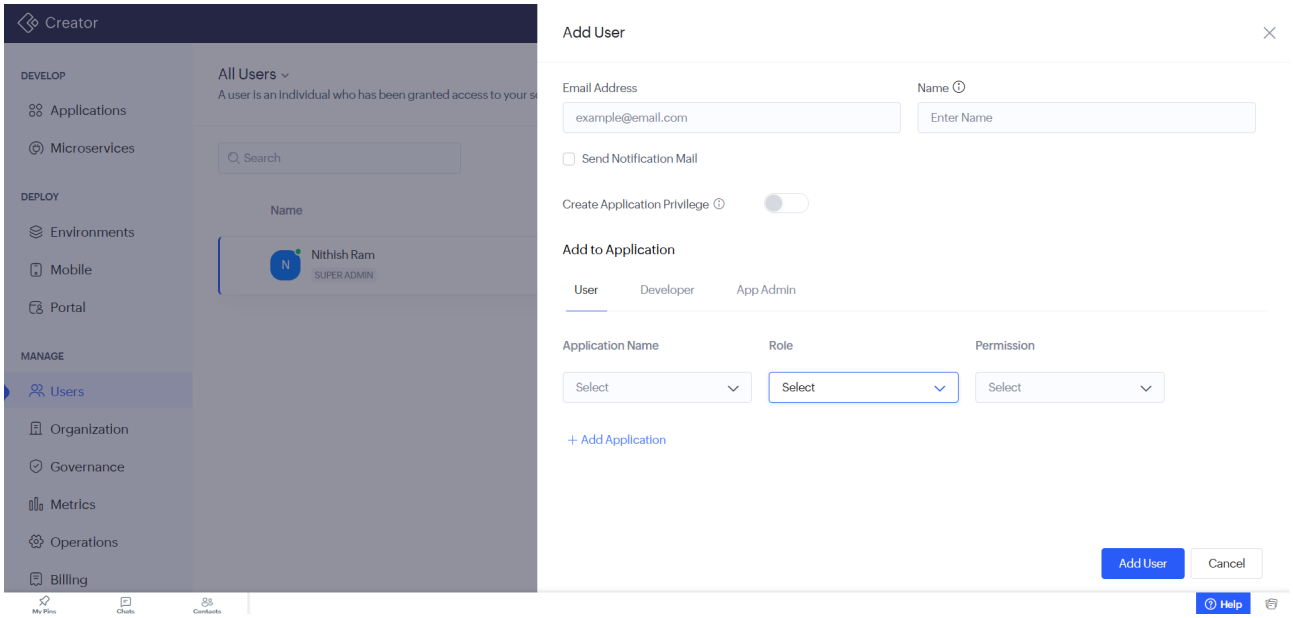

1. Open the Users section in Zoho Creator and choose Add User.
2. Enter the user's email address and name.
3. Select the Job Application app and assign an appropriate role and permission level.
4. Add the user and verify that the assigned access is correct.
5. Test with separate user accounts where available. Do not claim a role-based restriction has been verified unless it has actually been tested.

Suggested roles for this project

Role	Purpose in Job Application	Access
App Admin	Manage app setup, users and workflows	Administrative access
Recruiter	Review candidate details and update application status	Application records and related reports
Viewer	View permitted application information	Read-only access where configured

Screenshot: Add User in Zoho Creator

This screenshot shows the Add User panel, including email/name fields and application role/permission selection. Select the Job Application application in the Application Name field when carrying out the setup.

Verification checklist

- Confirm the user was added to the correct app.
- Confirm the selected role and permission are appropriate.
- Test whether a recruiter can access only the intended Job Application records and actions.
- Record any access checks that could not be tested in the current plan.

Result

The Add User process can be used to assign access to the Job Application app. Actual role restrictions should be reported as verified only after testing with the assigned account.
