Implementing Security Features and Governance Practices in Zoho Creator

Project: Job Application Management System

Aim

To apply suitable security controls, access permissions, and administration practices to protect candidate information in the Job Application Management System built using Zoho Creator.

Introduction

The Job Application Management System stores candidate details such as names, email addresses, phone numbers, resumes, skills, experience, job roles, and expected salary. Security controls help ensure that only authorized users can view or modify this information. Governance practices support consistent administration, responsible data handling, and controlled application changes.

Security Principles for the Project

Principle	Application
Confidentiality	Restrict access to candidate contact details, resumes, and expected salary to authorized users.
Integrity	Use required fields and validation rules to reduce incomplete or invalid application data.
Availability	Keep the app and reports accessible to authorized recruiters and administrators when required.

Access Control and Permissions

1. **Administrator:** manages application structure, forms, reports, workflows, and user access.

2. **Recruiter:** reviews applications and updates recruitment-related details only when permitted.

3. **Viewer (optional):** views approved reports without editing candidate records, if this profile is supported and configured.

Assign users the minimum permissions needed for their tasks. Configure form, report, page, and field permissions where supported by the current Zoho Creator plan. Do not assume a role is enforced until it has been tested with a separate authorized test account.

Data-Level Security

Control	Use in this project
Field-level access	Limit who can view or edit phone numbers, resumes, and expected salary.
Record-level filtering	Where applicable, configure recruiters to see only the applications assigned to them or within their permitted scope.
Sharing settings	Keep candidate reports and resumes private; share only with intended users.
Public access	Avoid publishing candidate records publicly. If an application form is public, expose only fields necessary for submission.

Administration and Governance Procedure

1. Review the list of users who can access the Job Application Management System.

2. Assign administrator and recruiter permissions according to their responsibilities.

3. Check form, report, dashboard, and field-sharing settings before inviting users.
4. Test with separate accounts to confirm that users cannot access functions outside their permissions.
5. Review available activity logs or audit information to track changes to application records.
6. Document changes to forms, validation workflows, reports, and dashboard components before publishing.
7. Remove or disable access for users who no longer need the application, where account controls permit.
8. Keep exported candidate data and backups in approved, access-controlled locations.

Security Review Checklist

Item	What to check
User permissions	Only authorized users can access the app.
Sensitive fields	Phone, resume, and salary data are not exposed unnecessarily.
Reports and dashboard	Charts and reports are shared only with intended users.
Data integrity	Validation rules prevent invalid expected salary entries.
Account limitations	Unavailable permission or audit features are recorded as limitations, not as completed configurations.

Conclusion

Security and governance for the Job Application Management System focus on protecting candidate information, applying role-appropriate access, maintaining accurate records, and reviewing sharing and administrative settings. The controls should be marked as implemented only after they are configured and tested in the current Zoho Creator account.
