EXPERIMENT 09

Zia and Built-in Analytics

Project: Job Application Management System

Aim

To evaluate available Zia assistance and built-in analytics in Zoho Creator for the Job Application Management System, while checking feature availability, data accuracy, privacy, permissions, and account-specific limits.

Procedure

1. Inspect Zia and AI availability. Open the Zoho Creator application and check the available AI Modeler/Zia features. Record which options are available in the current account. Do not assume that a feature is enabled if it is not visible or if the account displays an upgrade/trial restriction.

2. Prepare the application data. Use existing Job Application fields such as Job Role, Expected Salary, Experience, Skills, and application date. Use test records or de-identified data when trying AI prompts.

3. Try a Zia-assisted draft, if available. In a development copy, use a prompt such as: “For the Job Application Management System, draft a report that shows the number of applications for each Job Role and the average Expected Salary for each Job Role. Use the existing field names. Do not modify or delete records.” Review all generated output before using it.

4. Create native reports. Create or review reports for applications by Job Role, applications over time, and Expected Salary by Job Role. Add a bar chart comparing application counts by Job Role if the report builder permits it.

5. Test sentiment analysis, if available. If the Sentiment Analysis model is enabled, use a recruiter feedback text field as the source. Test with non-personal examples such as “The candidate communicated clearly” and verify the returned classification. If the feature is unavailable, record it as not available in the current account.

6. Verify results. Compare report totals against the records in the form. Check that only authorized users can view application data. Do not enter real applicant personal information into prompts unless approved.

Example Zia Prompt

> Create a report for my Job Application Management System showing the number of applications for each Job Role, the average Expected Salary by Job Role, and a chart comparing application counts across roles. Use the existing Job Application data. Do not change or delete any records.

AI Modeler — Available Ready-to-Use Models

The screenshot below was captured from the user's Zoho Creator AI Modeler screen. It shows the model cards Keyword Extraction, Sentiment Analysis, OCR (Pre-Built), and Object Detection (Pre-Built). The Sentiment Analysis card is visible, but this screenshot does not prove deployment was completed.

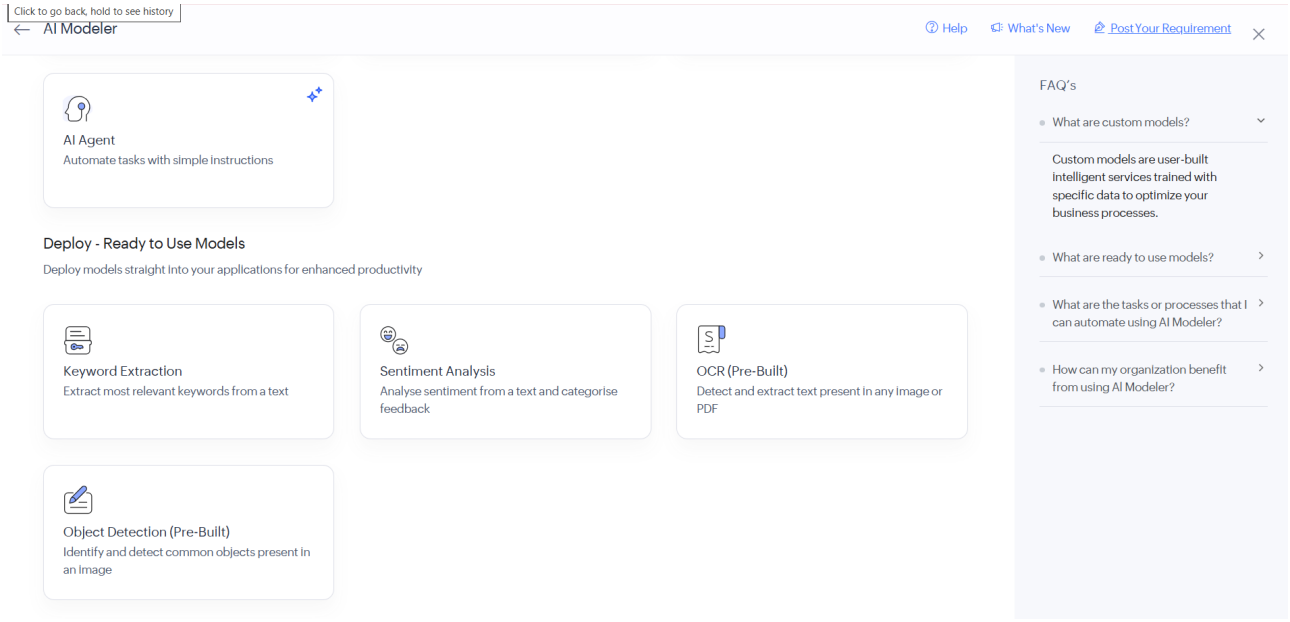

Figure 1. User-provided screenshot of the AI Modeler page in Zoho Creator.

Implementation and Verification

Check	How to verify	Status to record
AI feature availability	Confirm whether Sentiment Analysis can be opened and deployed.	Available / restricted
Analytics	Compare each report total with the source application records.	Verified / needs review
Privacy	Use test data and avoid unnecessary personal details in prompts.	Checked / needs review
Human review	Review any AI-generated report or logic before use.	Reviewed / not tested

Result

The Job Application Management System is evaluated for Zia-assisted functionality and built-in analytics. Native reports can be checked against application records. Sentiment Analysis and other AI functions are reported as implemented only after successful deployment and testing; if blocked by account limits, the limitation is documented rather than claiming an unverified result.

Note: The screenshot is evidence of the AI Modeler options visible in the account, not evidence that Sentiment Analysis has been deployed or executed.
