EXP – 7

Integrate using Connections – Job Application

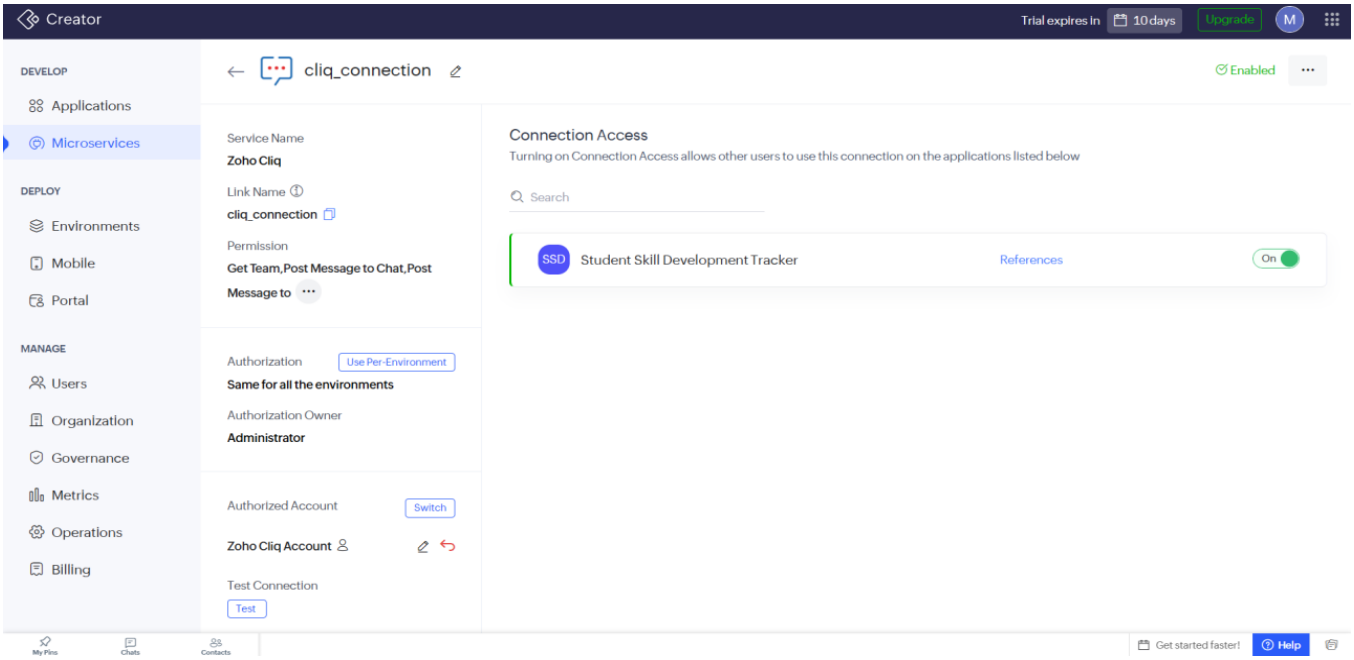

Aim

To integrate the Job Application form with Zoho Cliq using an authenticated connection and send a notification when a new application is submitted.

Procedure

1. Open Zoho Creator and go to Settings / Microservices / Connections.
2. Use an authorized Zoho Cliq connection named **cliq_connection**, if one is already available for this app.
3. Open the **job_application_submitted** successful form submission workflow.
4. Add a Deluge action to send a message to the configured Cliq channel after a job application is submitted.
5. Test the workflow with a sample application and verify the notification.

Connection screenshot (from the earlier reference PDF)

Deluge script template

```
response = invokeurl
[
    url :"https://cliq.zoho.in/api/v2/channelsbyname/cliq_connection/message"
    type :POST
    parameters: {"text":"New job application submitted"}
    connection:"cliq_connection"
];
info response;
```

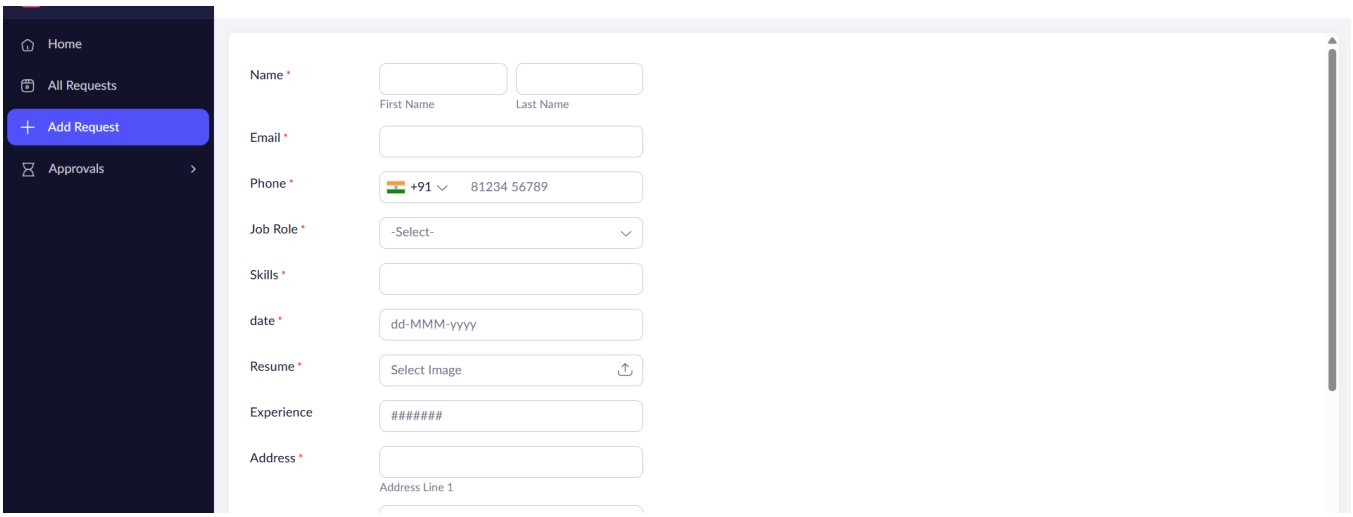

Note: The connection screenshot is from the previously supplied reference PDF. It shows an existing connection associated with another app, so confirm access is enabled for Job Application before using it.

EXP – 7

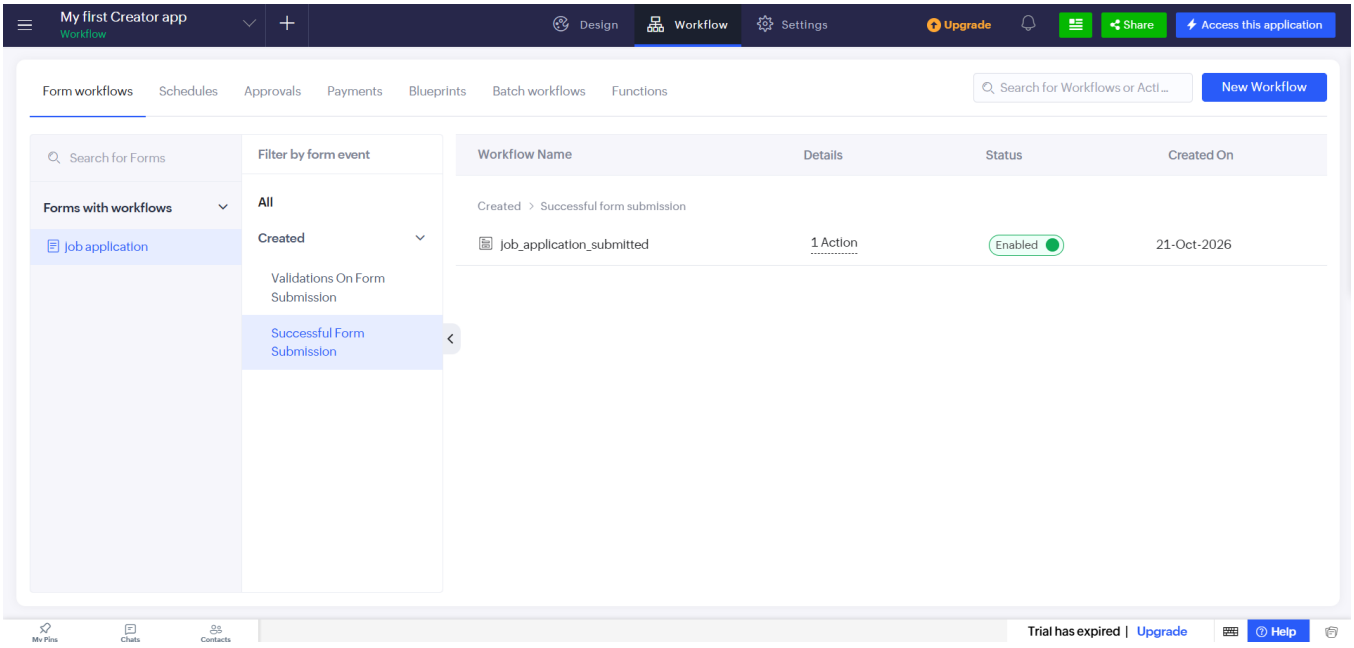

Job Application – Workflow and Verification

Application form

The notification is intended to run after a record is submitted in the Job Application form.

Workflow configuration

Result

Expected result: after a new job application is submitted, Zoho Cliq receives a message saying “New job application submitted.” Confirm the connection is authorized and test the notification before treating the integration as complete.

Current limitation

Zoho Creator displayed “Reached maximum connection limit” when a new connection was attempted. Therefore, the new connection could not be created during this attempt. Reuse an existing authorized Cliq connection if permitted, or request an available connection slot/plan access. The script above is a template and is not proof of a successful notification.
