EXPERIMENT 07

Integration Using Connections

Title: Job Application Management System

Aim

To integrate the Job Application form in Zoho Creator with Zoho Cliq using an authenticated connection, so a notification can be sent when a new application is submitted.

Procedure

1. Create the Job Application form in Zoho Creator with fields such as Name, Email, Phone, Job Role and Skills.
2. Create a workflow that runs after successful form submission.
3. Configure an authorized Zoho Cliq connection in Creator, if the current plan allows it.
4. Use Deluge to prepare a message with the applicant's relevant details and send it through the connection.
5. Submit a test application and verify the notification in Zoho Cliq.

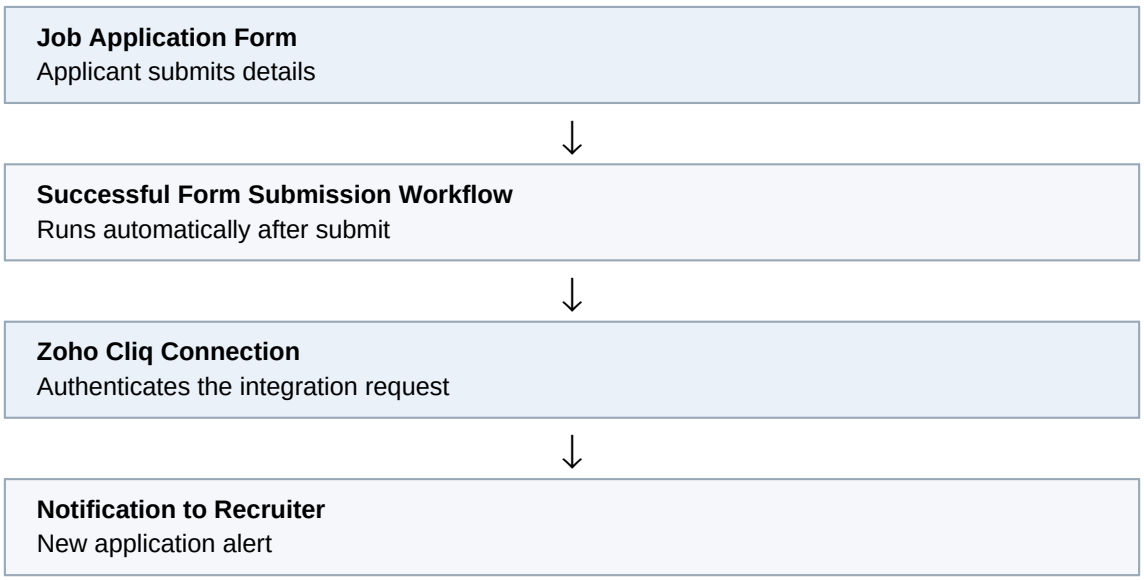
Deluge script template

Use this as a template only. Replace field link names and the Cliq API details with the values supported by your Creator app and connection.

```
// Successful form submission workflow message = "New job application submitted."; message = message +
"\\nName: " + input.Name; message = message + "\\nJob Role: " + input.Job_Role; // Requires a
configured and authorized Zoho Cliq connection. // Add the appropriate Cliq API endpoint and
connection name // after confirming the current Zoho Cliq API requirements.
```

Connection setup evidence

The supplied reference material contains a connection setup screenshot from another example. The unrelated profile label and Student Assessment example are not used as proof of this project. Use a screenshot from your own Job Application app for actual implementation evidence.



Illustrative workflow diagram — not a screenshot of a completed live integration.

Result

The workflow and Deluge template describe how the Job Application app can notify a recruiter through Zoho Cliq. In the current account, Creator displayed a maximum connection limit, so the live connection and notification still need to be configured and tested before claiming successful integration.
